

FACULTY OF COMPUTING · LEADERSHIP BRIEFING

SIMADRepair

The IT service desk behind the Computer Maintenance Program

SIMAD University · October 2026

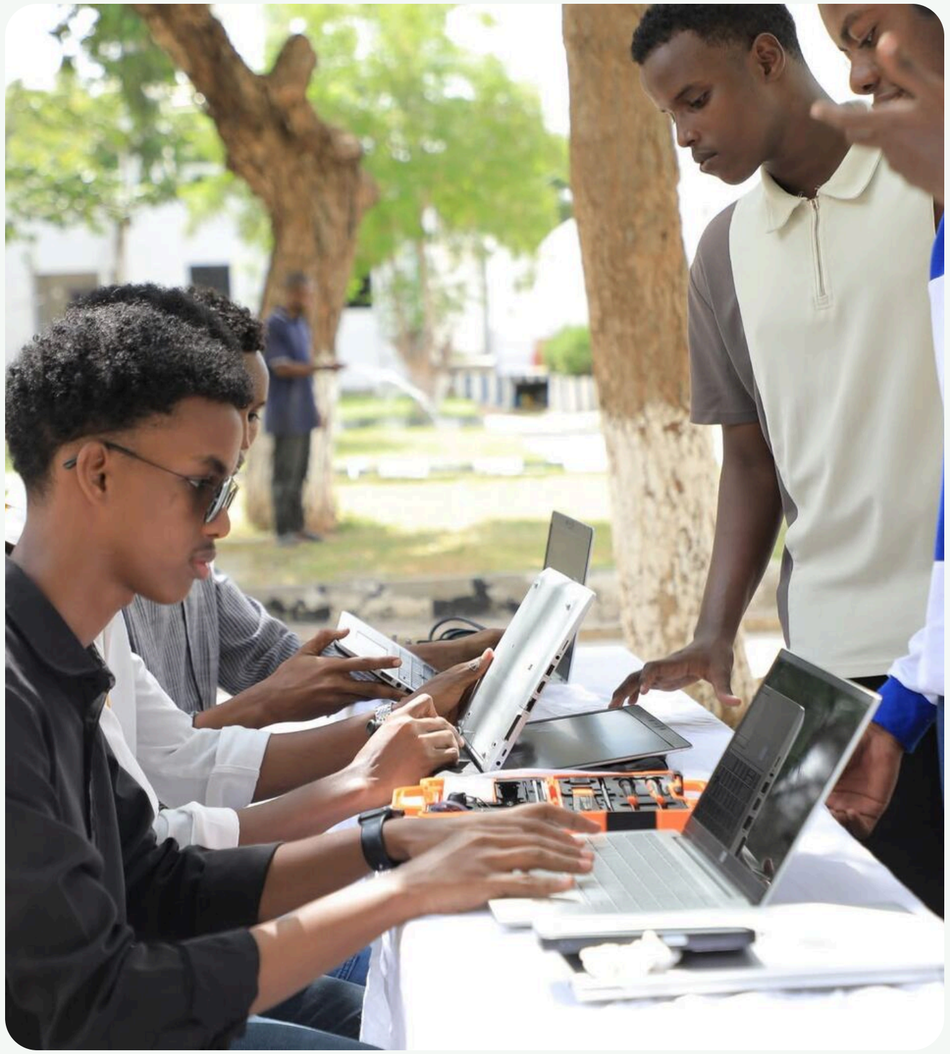

THE PROGRAM

Computer Maintenance Program 2026

27–28 October · Main Campus, SIMAD University

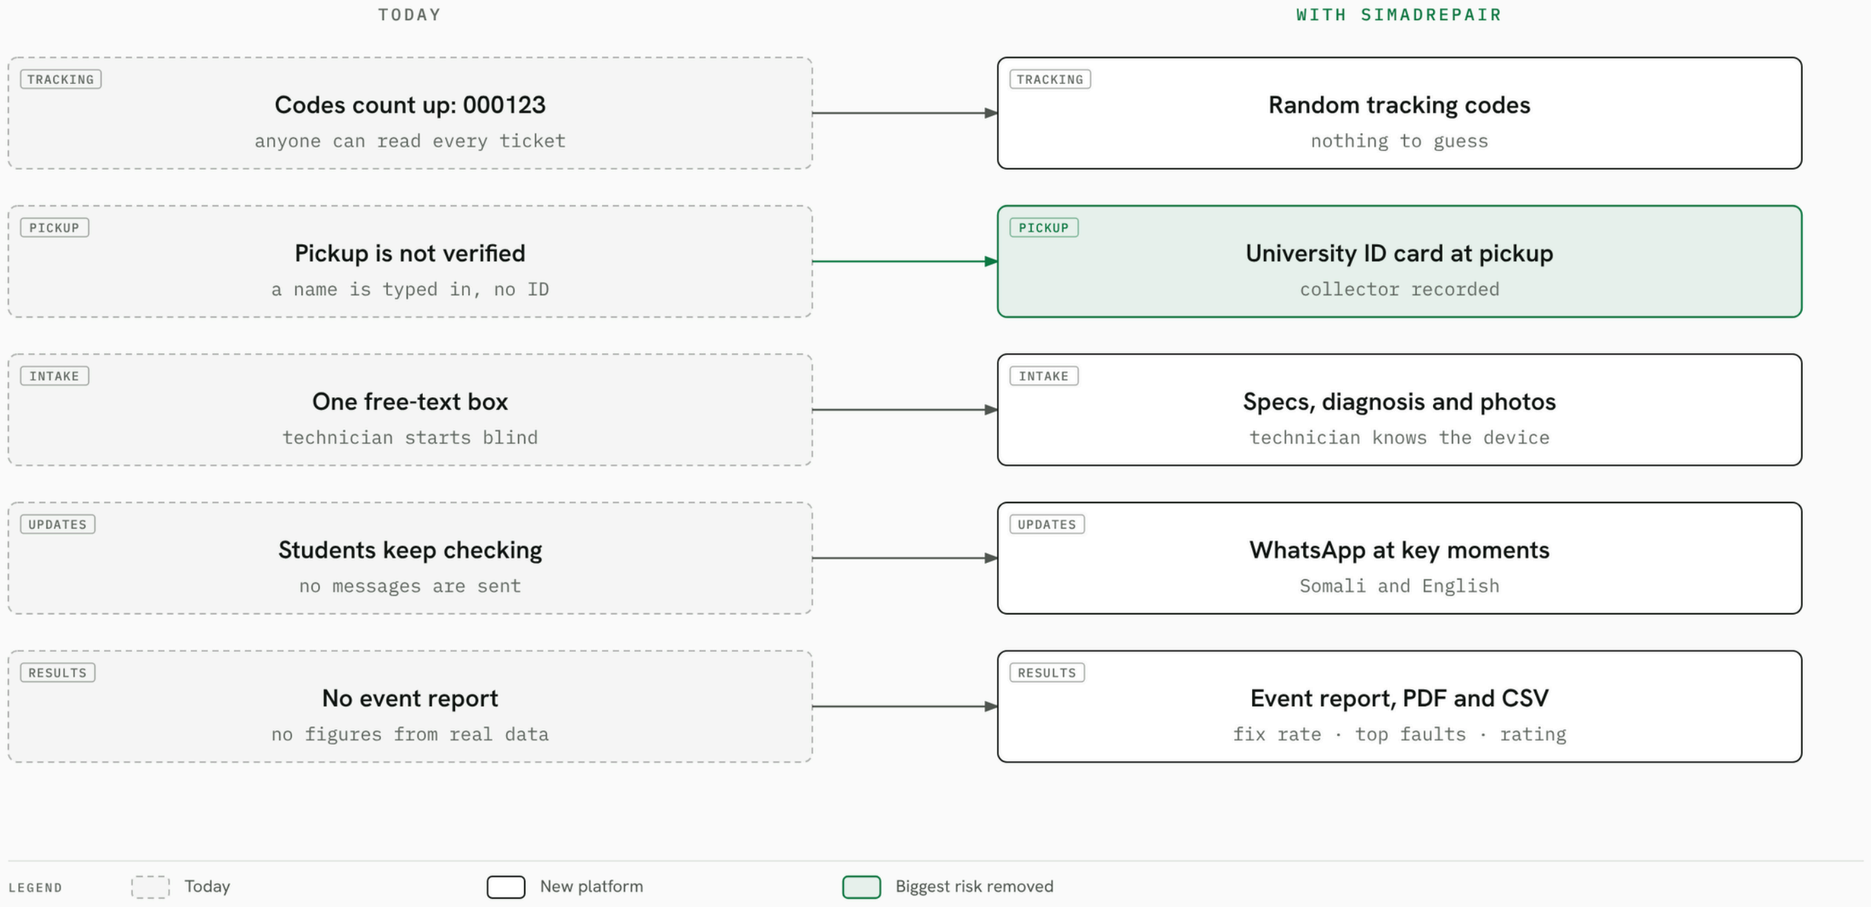

A free tune-up for every SIMAD student and staff laptop:

1. Hardware check and cleaning
2. Windows installation and software updates
3. Virus and malware scanning
4. Data backup assistance
5. Network connectivity testing

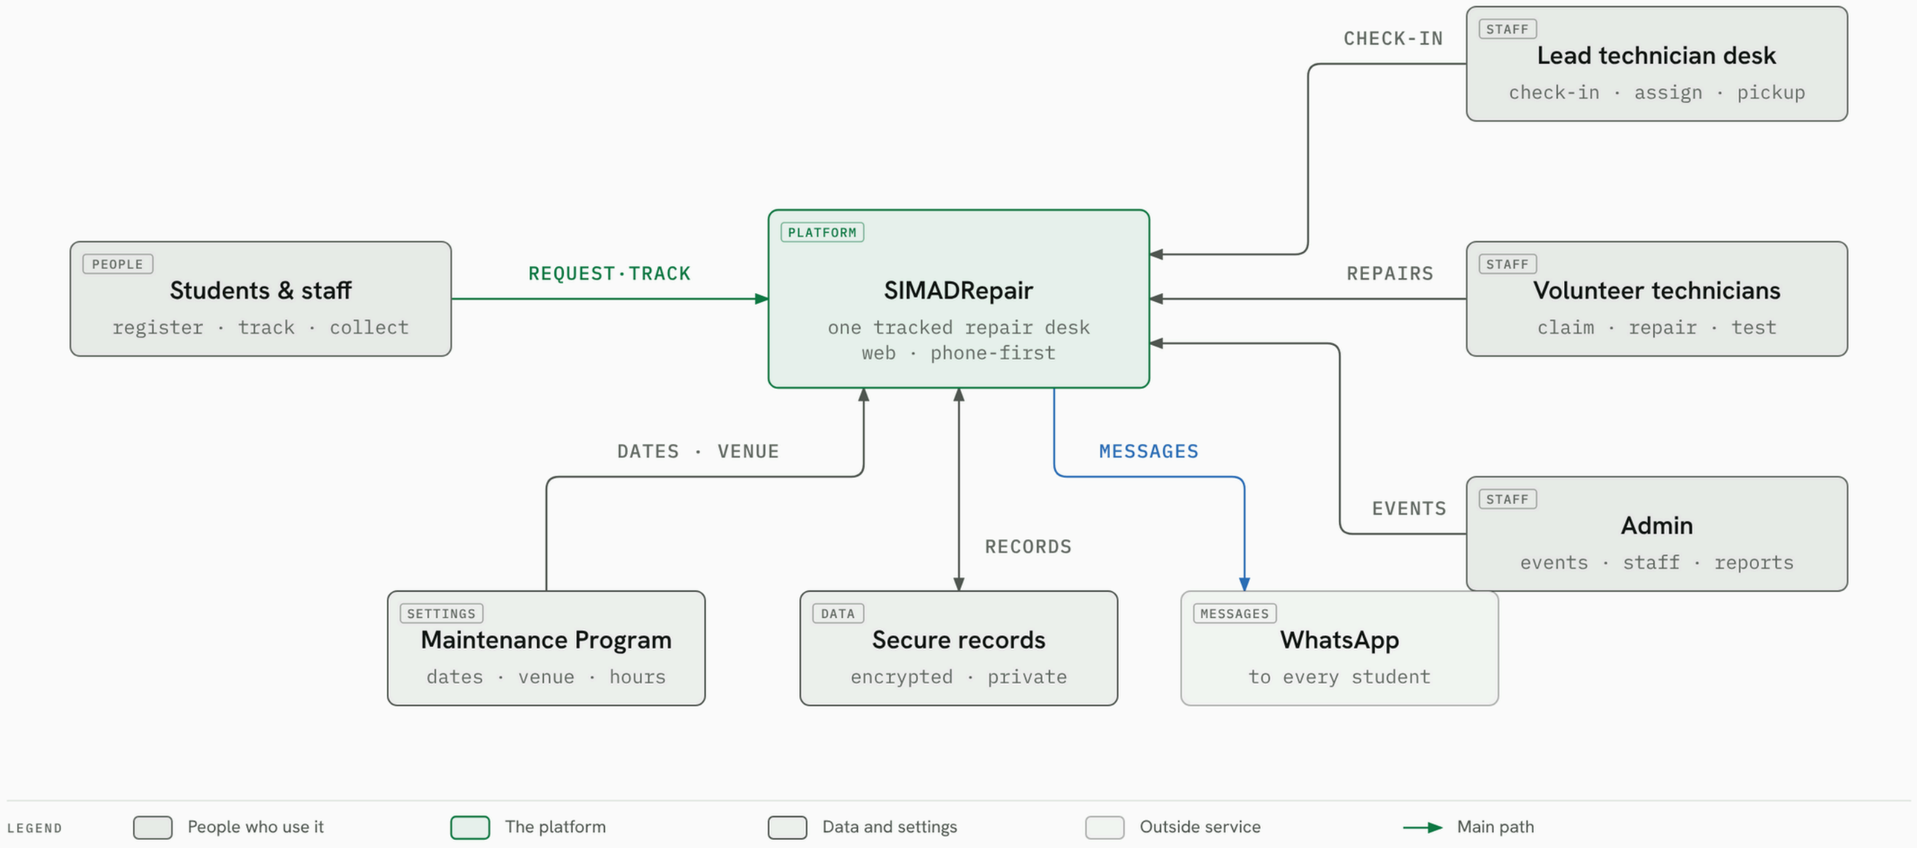

Five problems the new platform removes

Each row is a weakness of today's system and the change that removes it. The biggest real-world risk, unverified pickup, is highlighted.

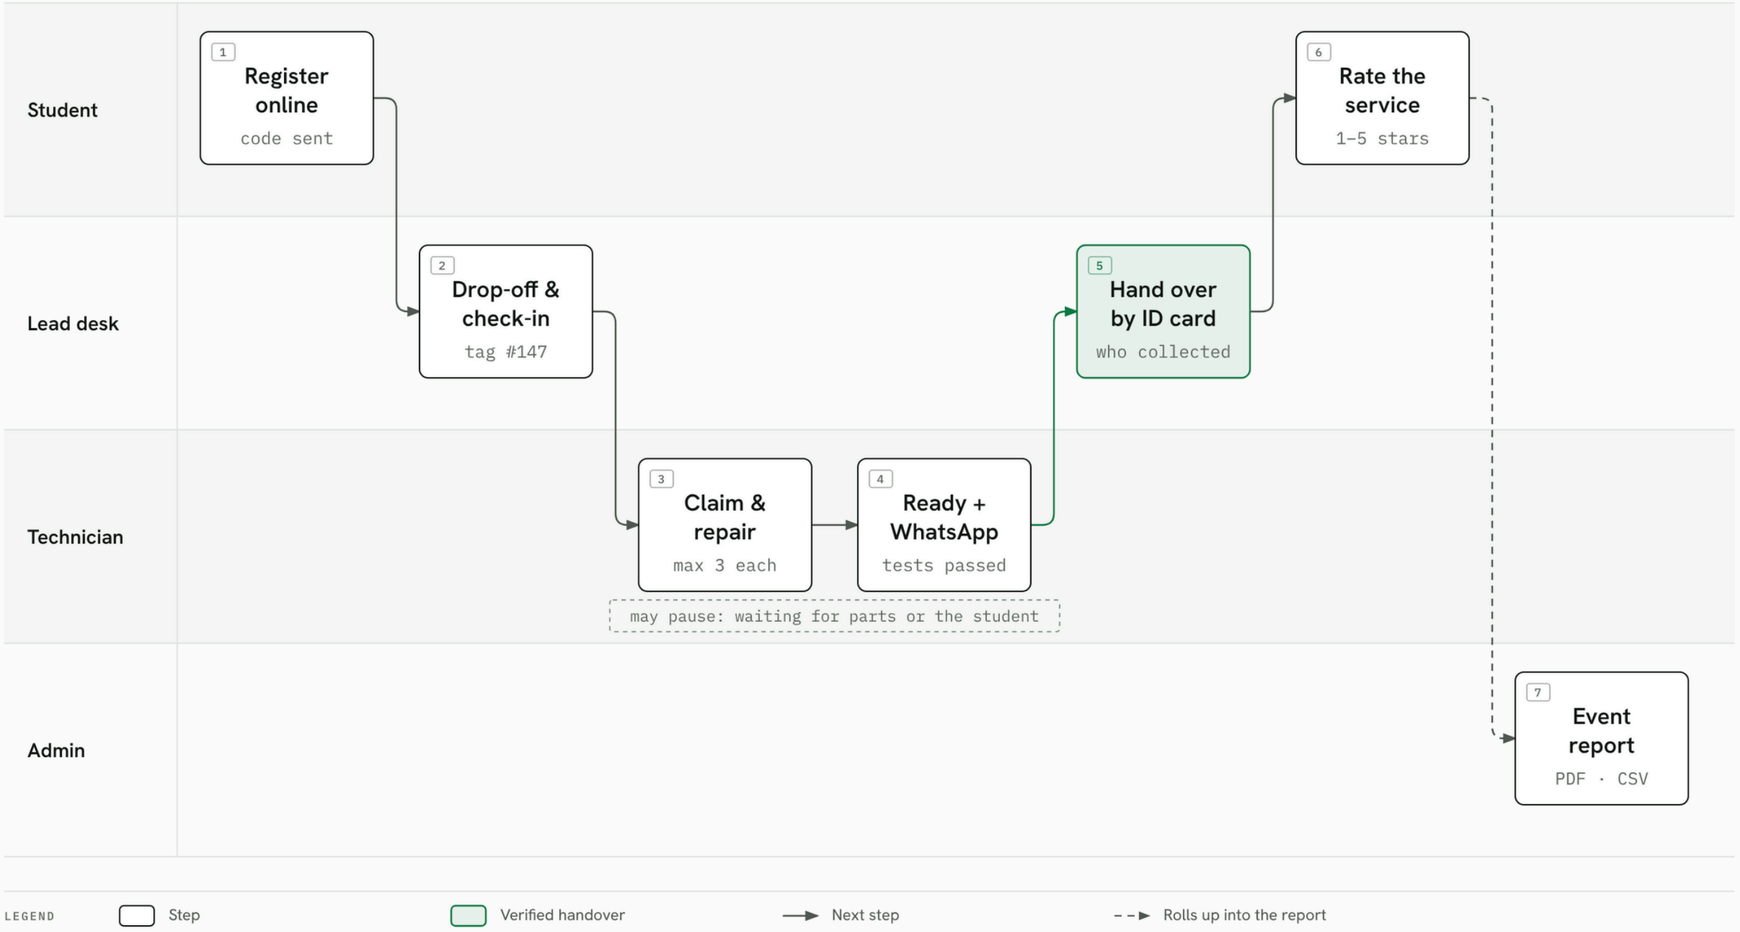

One desk for every repair

Students register online; three staff roles run the program on the same platform; every step is saved and the student is kept informed on WhatsApp.

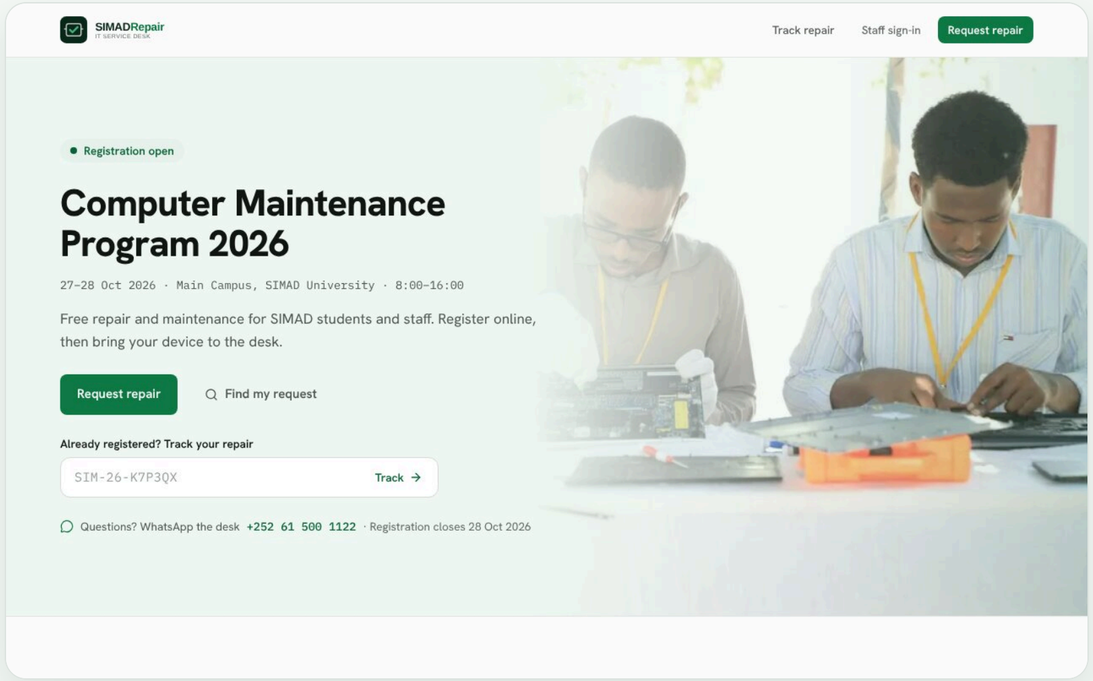

Who does what, from registration to report

Every handoff between the student, the desk, the technician and the admin happens in the platform, so nothing is lost between people.

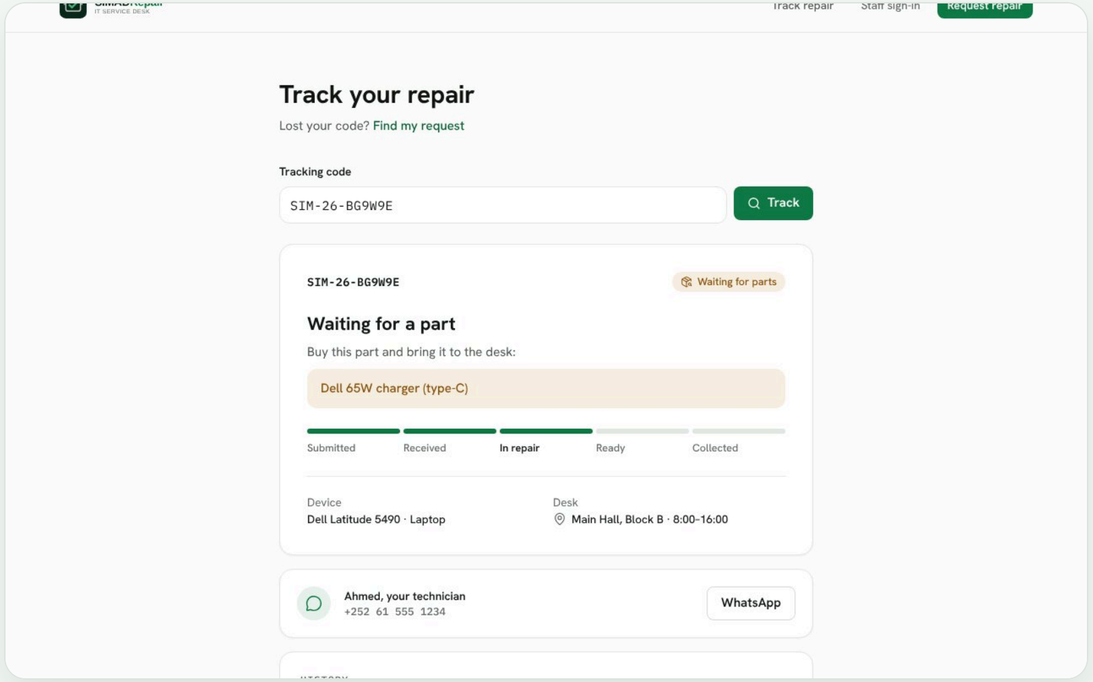

STUDENTS

Register on the phone, follow every step

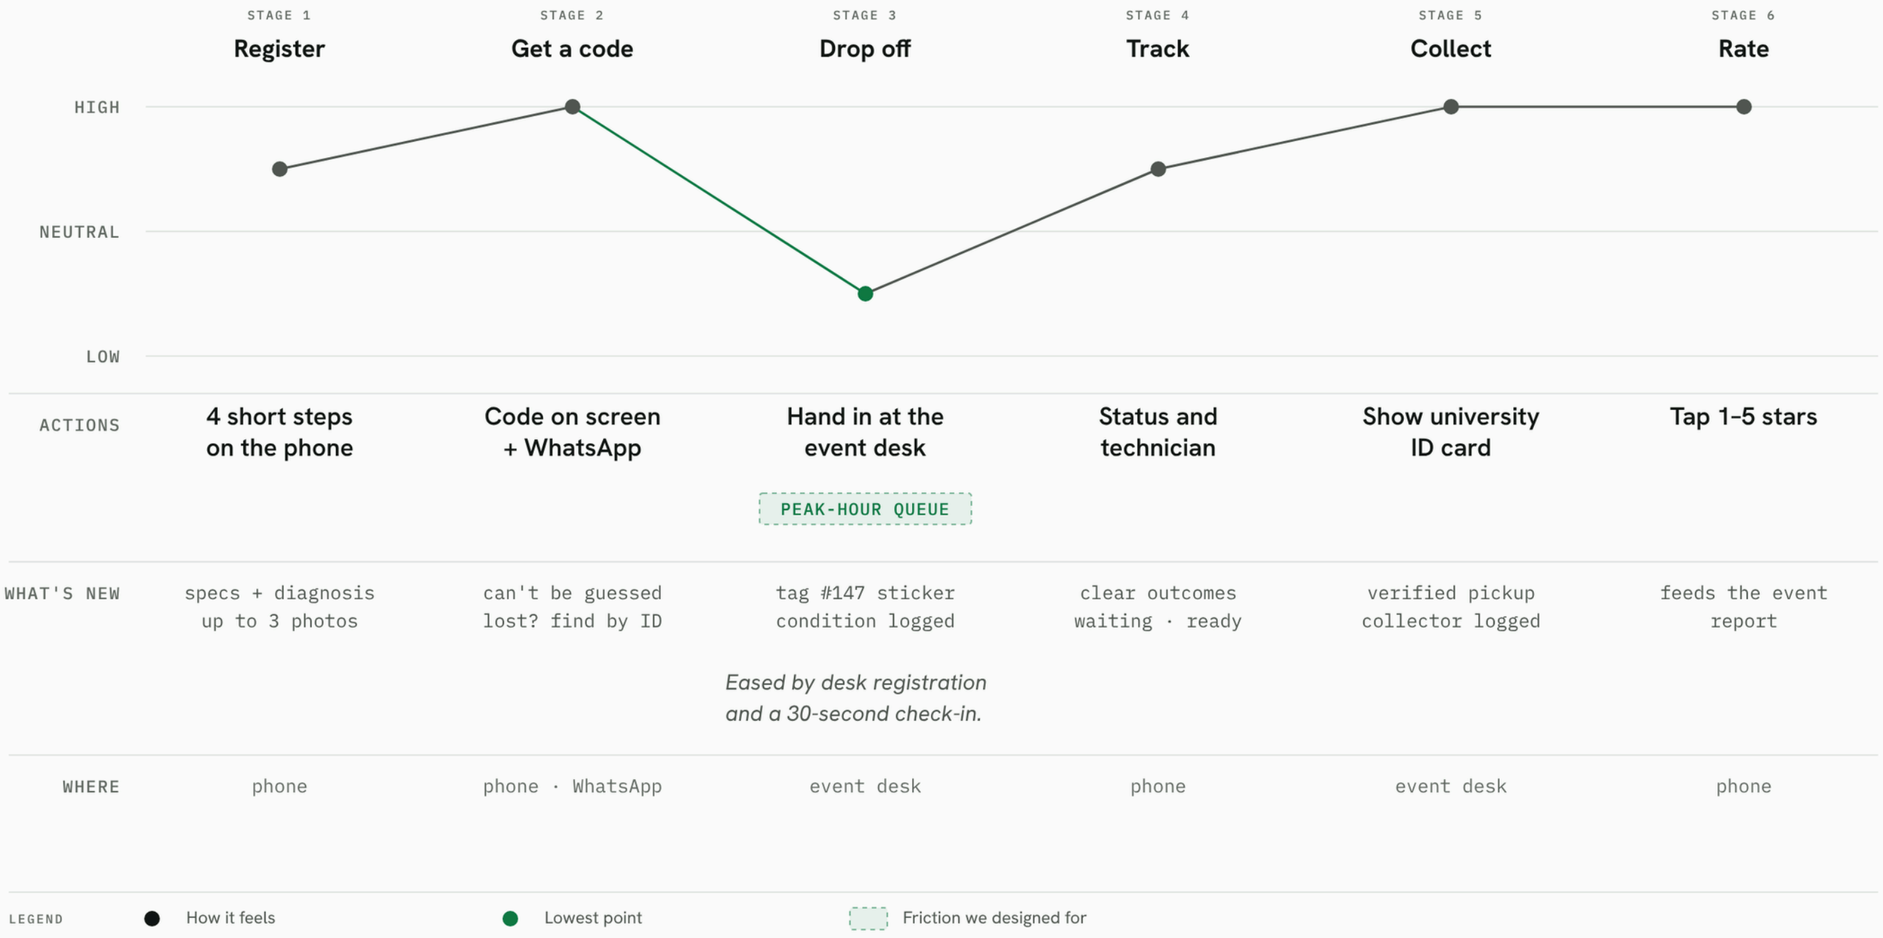

Home: program dates, venue and one button to request a repair

Tracking: live status, what to bring, and the technician on WhatsApp

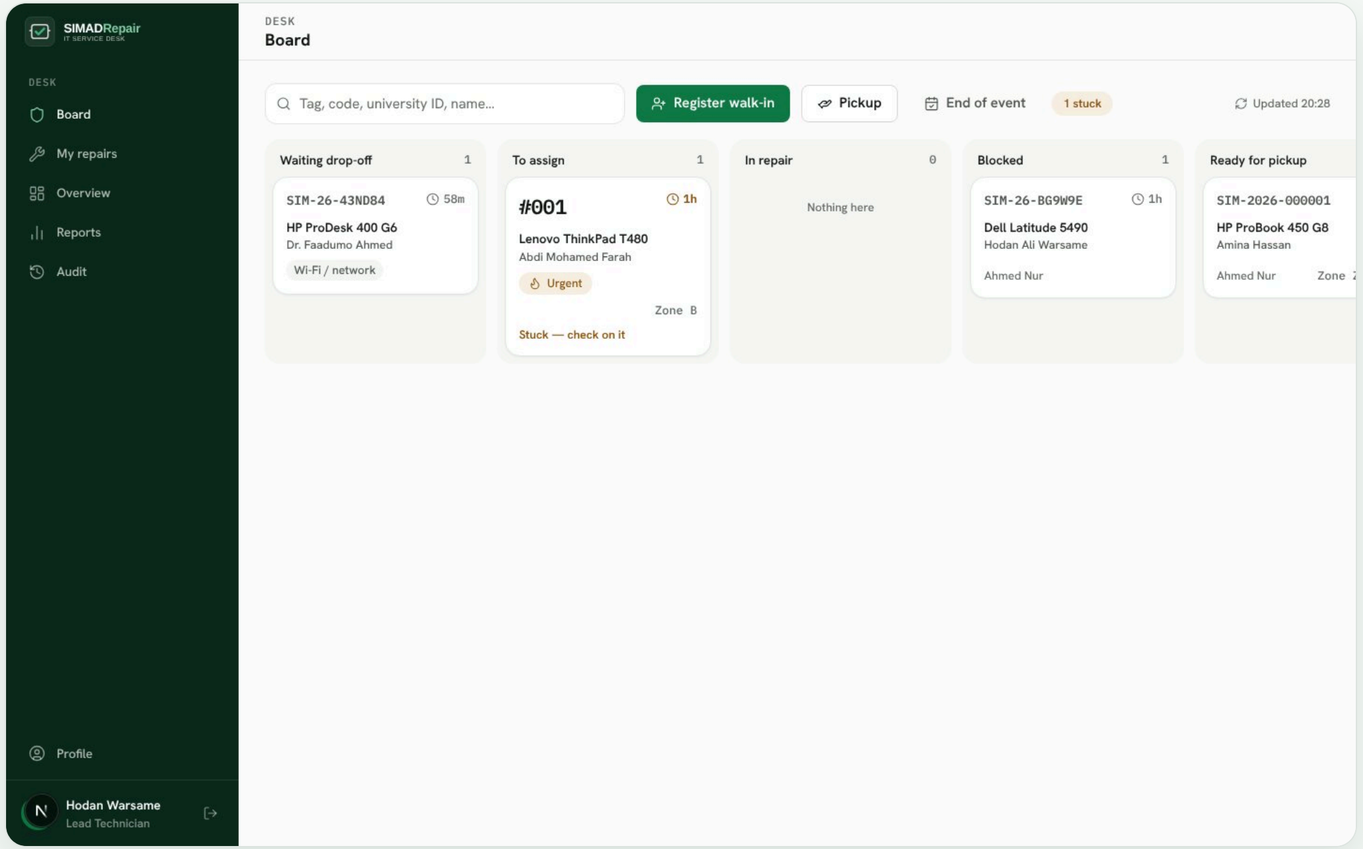

What a student experiences

From registering on a phone to collecting with their ID card: six stages, each with a concrete improvement over today.

LEAD TECHNICIAN DESK

Every device on one live board

Check-in in ~30 seconds

ID card, condition, tag sticker #147

Assign by load and skill

Or volunteers claim up to 3 each

Stuck alerts

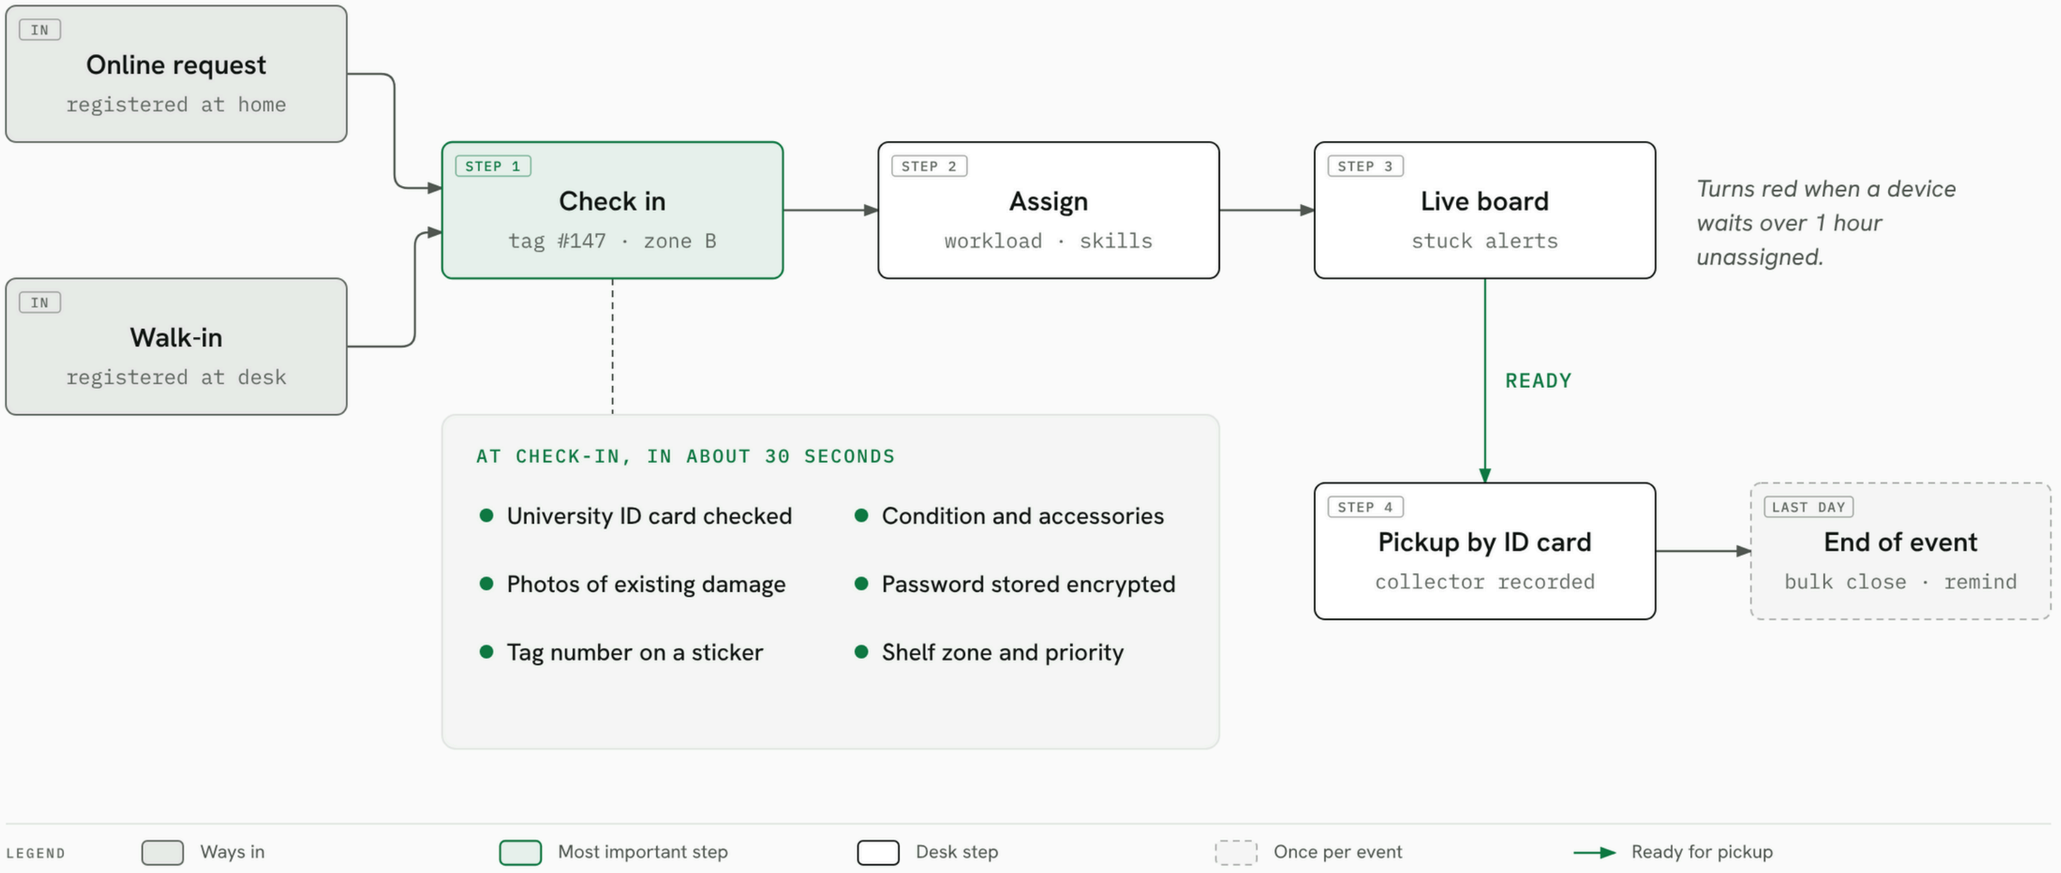

Unassigned over 1 hour turns red

Pickup by ID card

Collector name and phone recorded

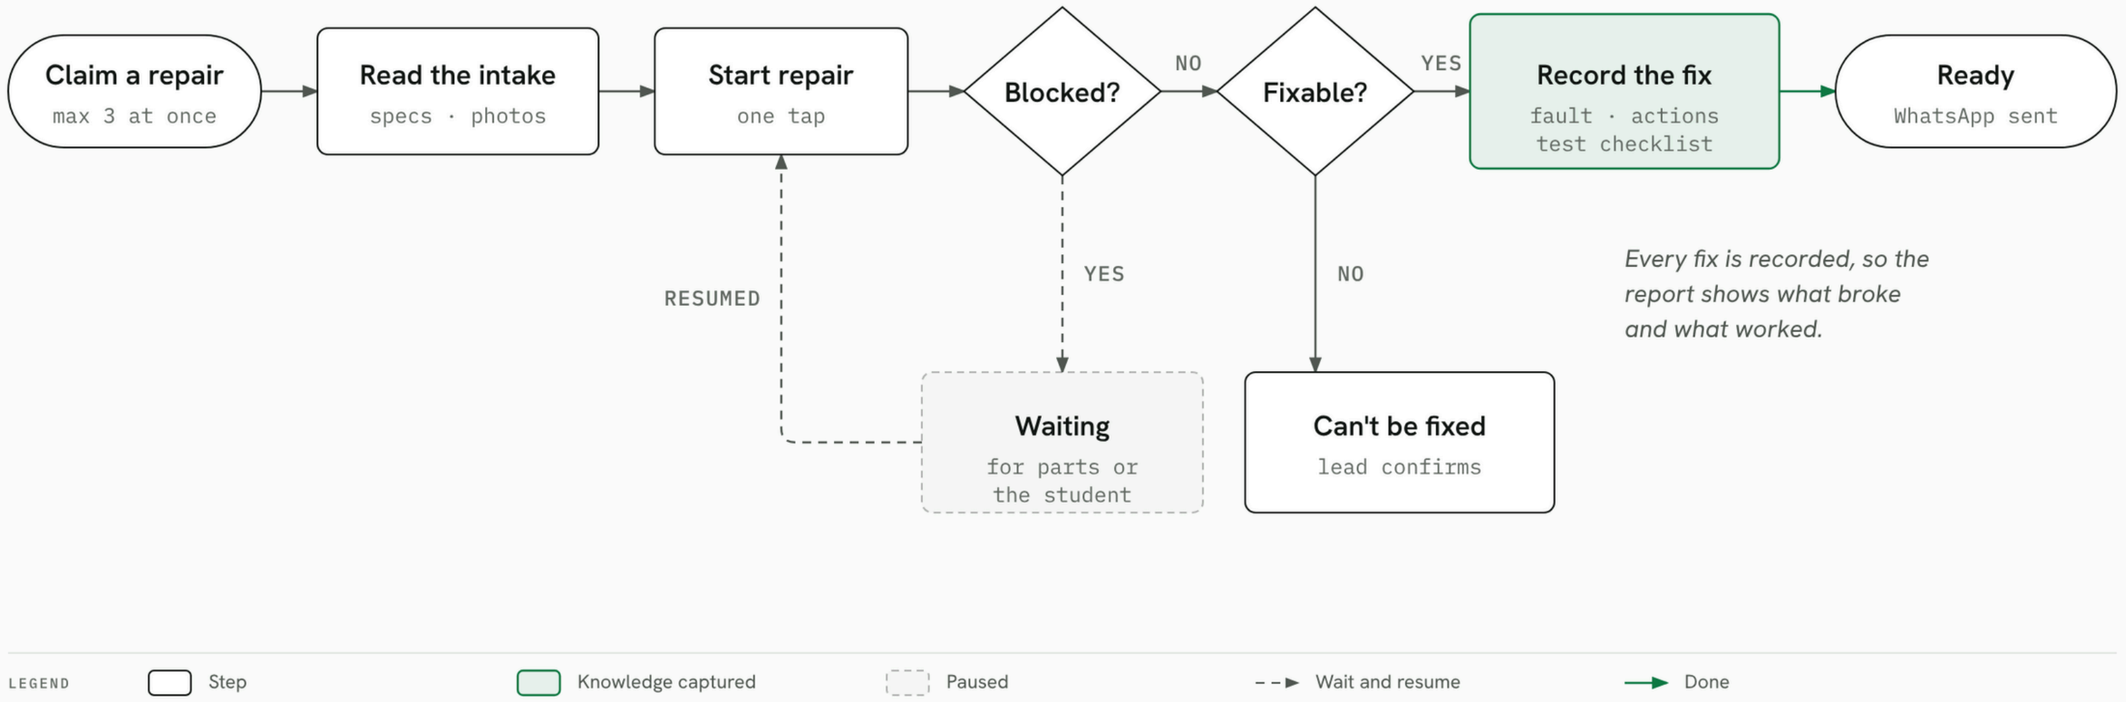

Running the desk for 500 devices

Every device is identified at check-in, routed to the right technician, watched on a live board and released only against the owner’s university ID card.

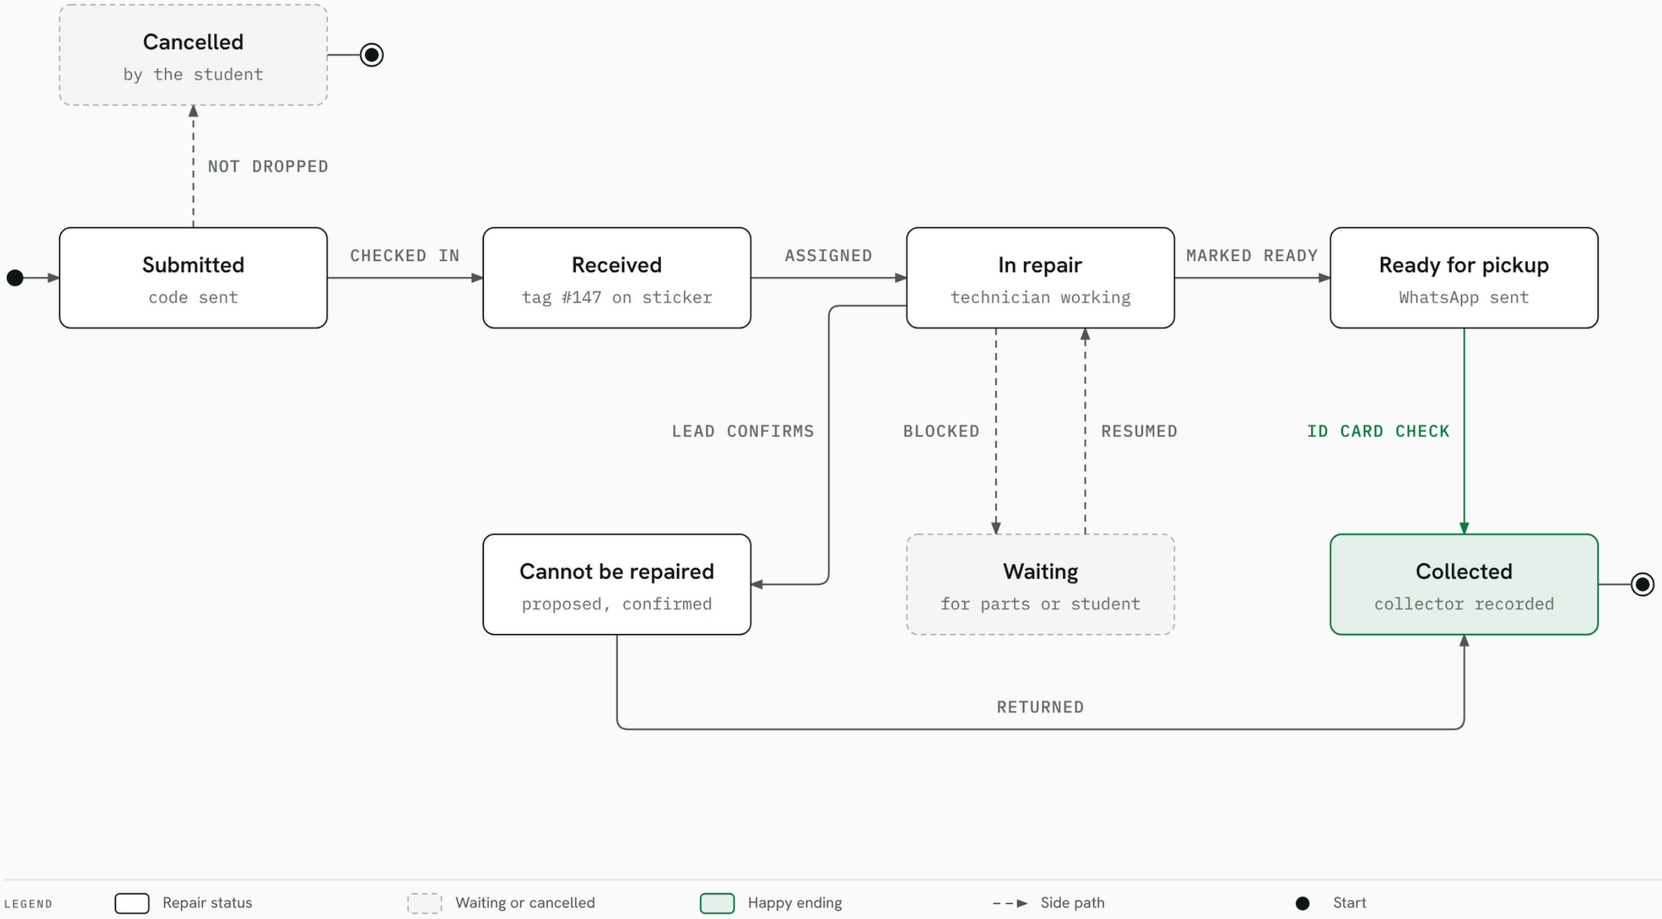

From claim to ready, on a phone

Technicians pick work themselves, see everything the student and the desk recorded, and cannot mark a device ready without recording the fix and passing the tests.

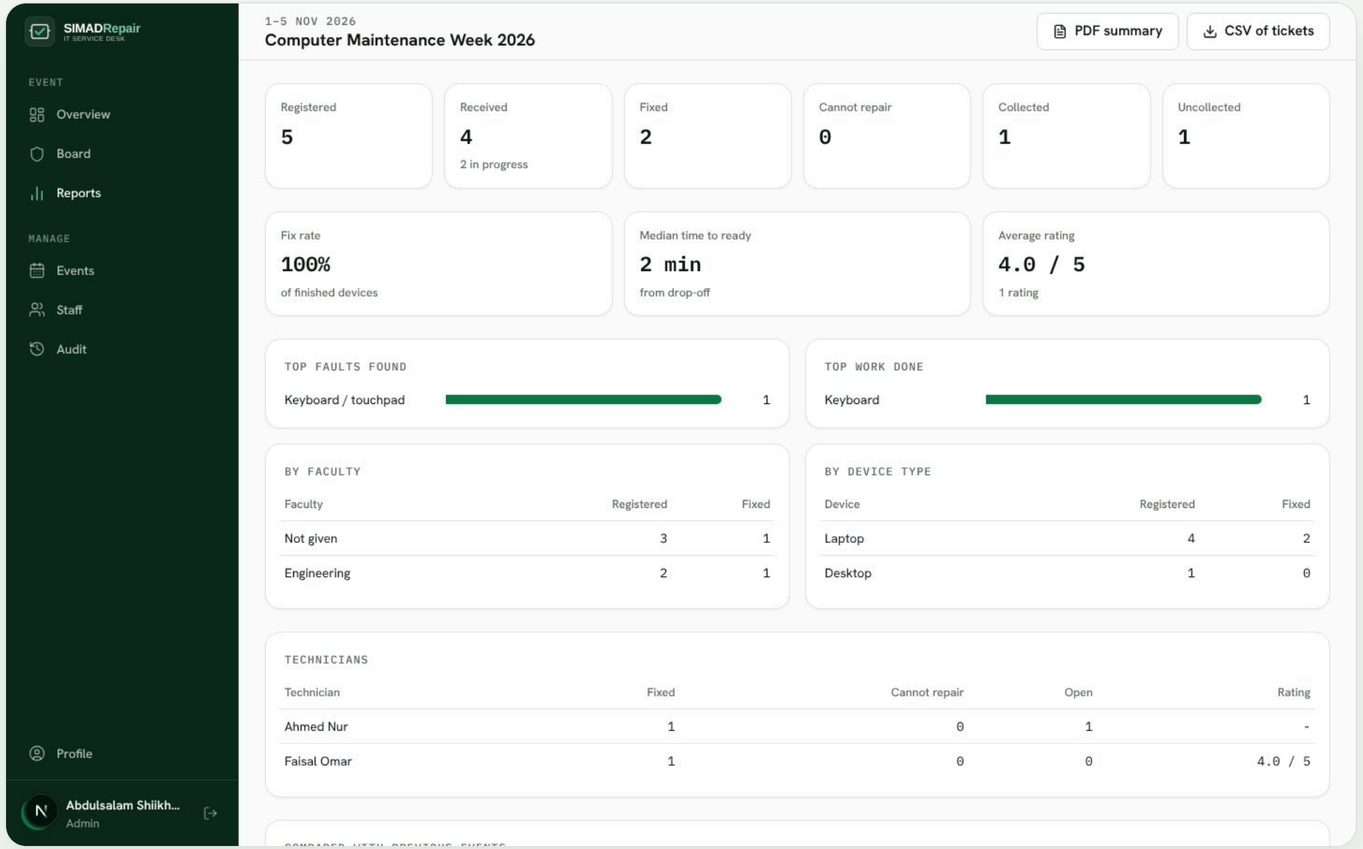

Every repair ends with a clear outcome

One status system replaces two that were kept in sync by hand. Waits, cancellations and “cannot be repaired” are now visible to the student instead of hiding behind “in repair”.

ADMIN AND REPORTING

A report from real data after every event

Live overview

Today’s numbers, stuck devices, technician load

Event report

Fix rate, top faults, by faculty, ratings

One-page PDF + CSV

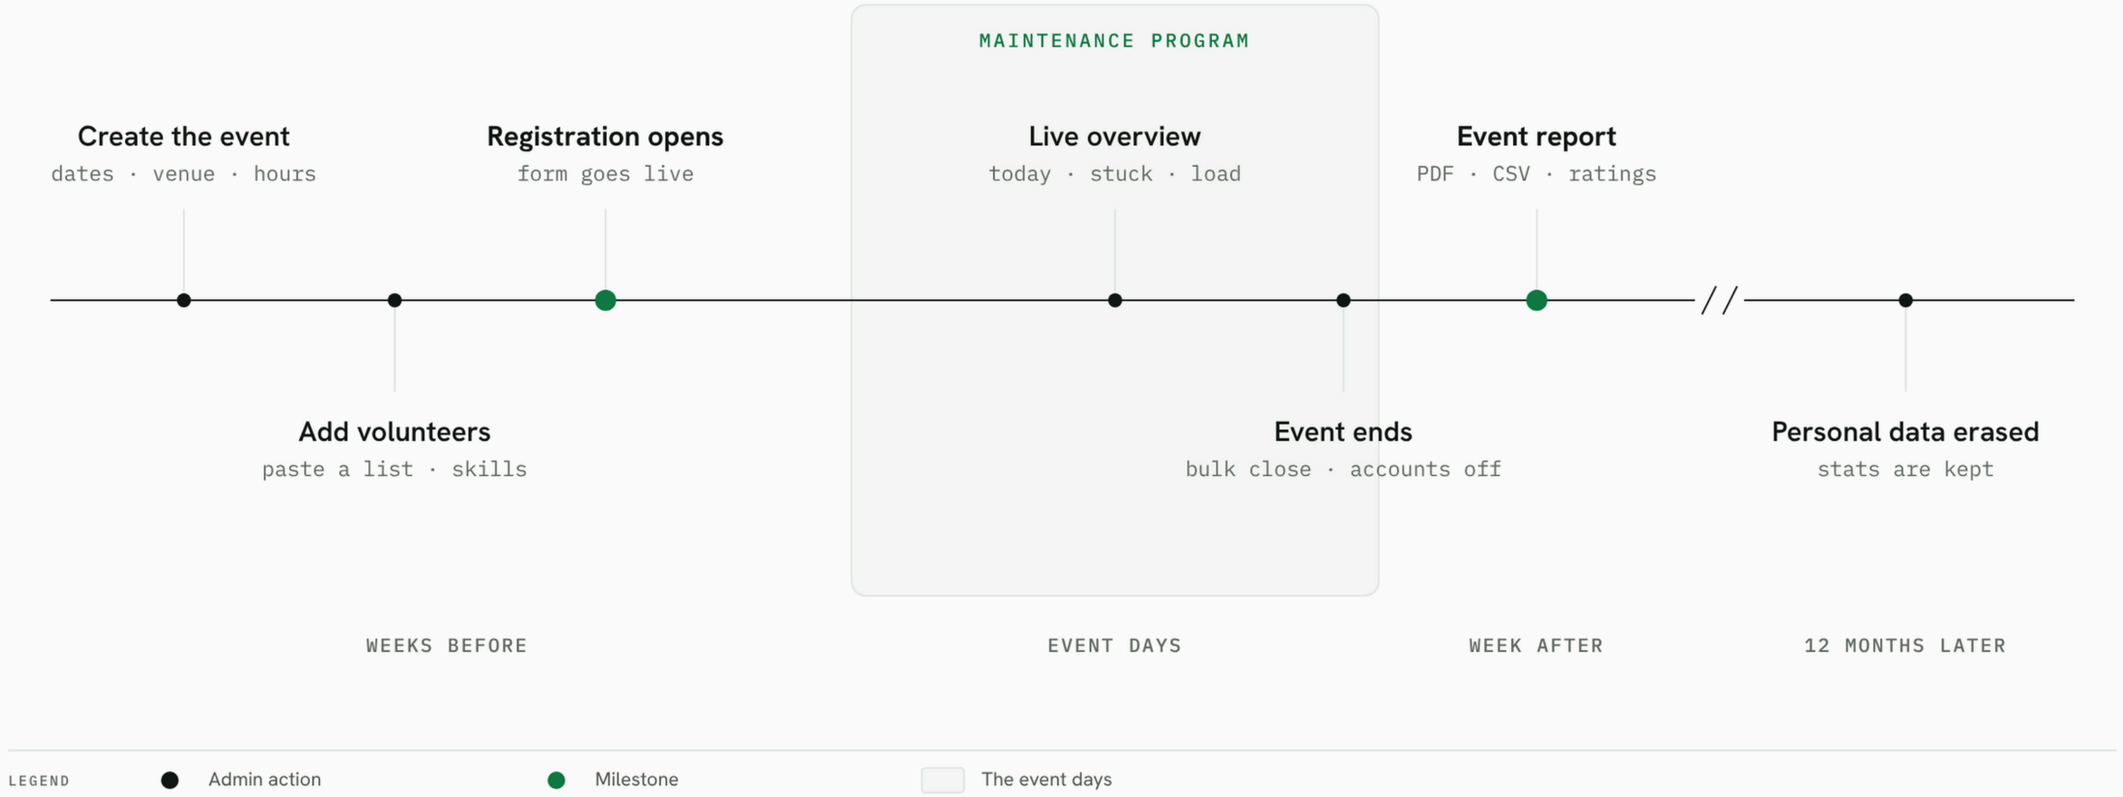

For faculty heads and management

Audit search

Any ticket by code, tag or university ID

One event, from setup to report

The admin sets the event up once; registration, volunteer accounts, the report and data clean-up all follow the event's dates automatically.

TRUST AND PRIVACY

Students’ devices and data stay protected

Random tracking codes

Nothing to guess from someone else’s code

Pickup by ID card

The desk checks the card and records who collected

Passwords encrypted

Deleted at pickup or when the event ends

Full audit trail

Who did what, when and why, for every step

Erased after 12 months

Personal details go; anonymous statistics stay

Access by role

Volunteer access ends with the event

WHY IT MATTERS

Every repair leaves a record: what was wrong, what we fixed and who took it home.

READINESS

Ready for 27–28 October

Built and tested

- Website, registration and tracking
- Desk board, check-in and pickup
- Technician workspace on the phone
- WhatsApp messages in Somali and English
- Event report, PDF and CSV

Before 27 October

- Set the event: hours and desk WhatsApp
- Add the volunteer accounts
- Share the registration link with students
- Native-speaker check of Somali messages
- Strong admin password on the live site

BUILT BY

Faculty of Computing Engineering Team

Eng. Muscab Abdirashid
Team Lead Engineer

Eng. Ishak Abdiaziz
Full Stack Software Engineer

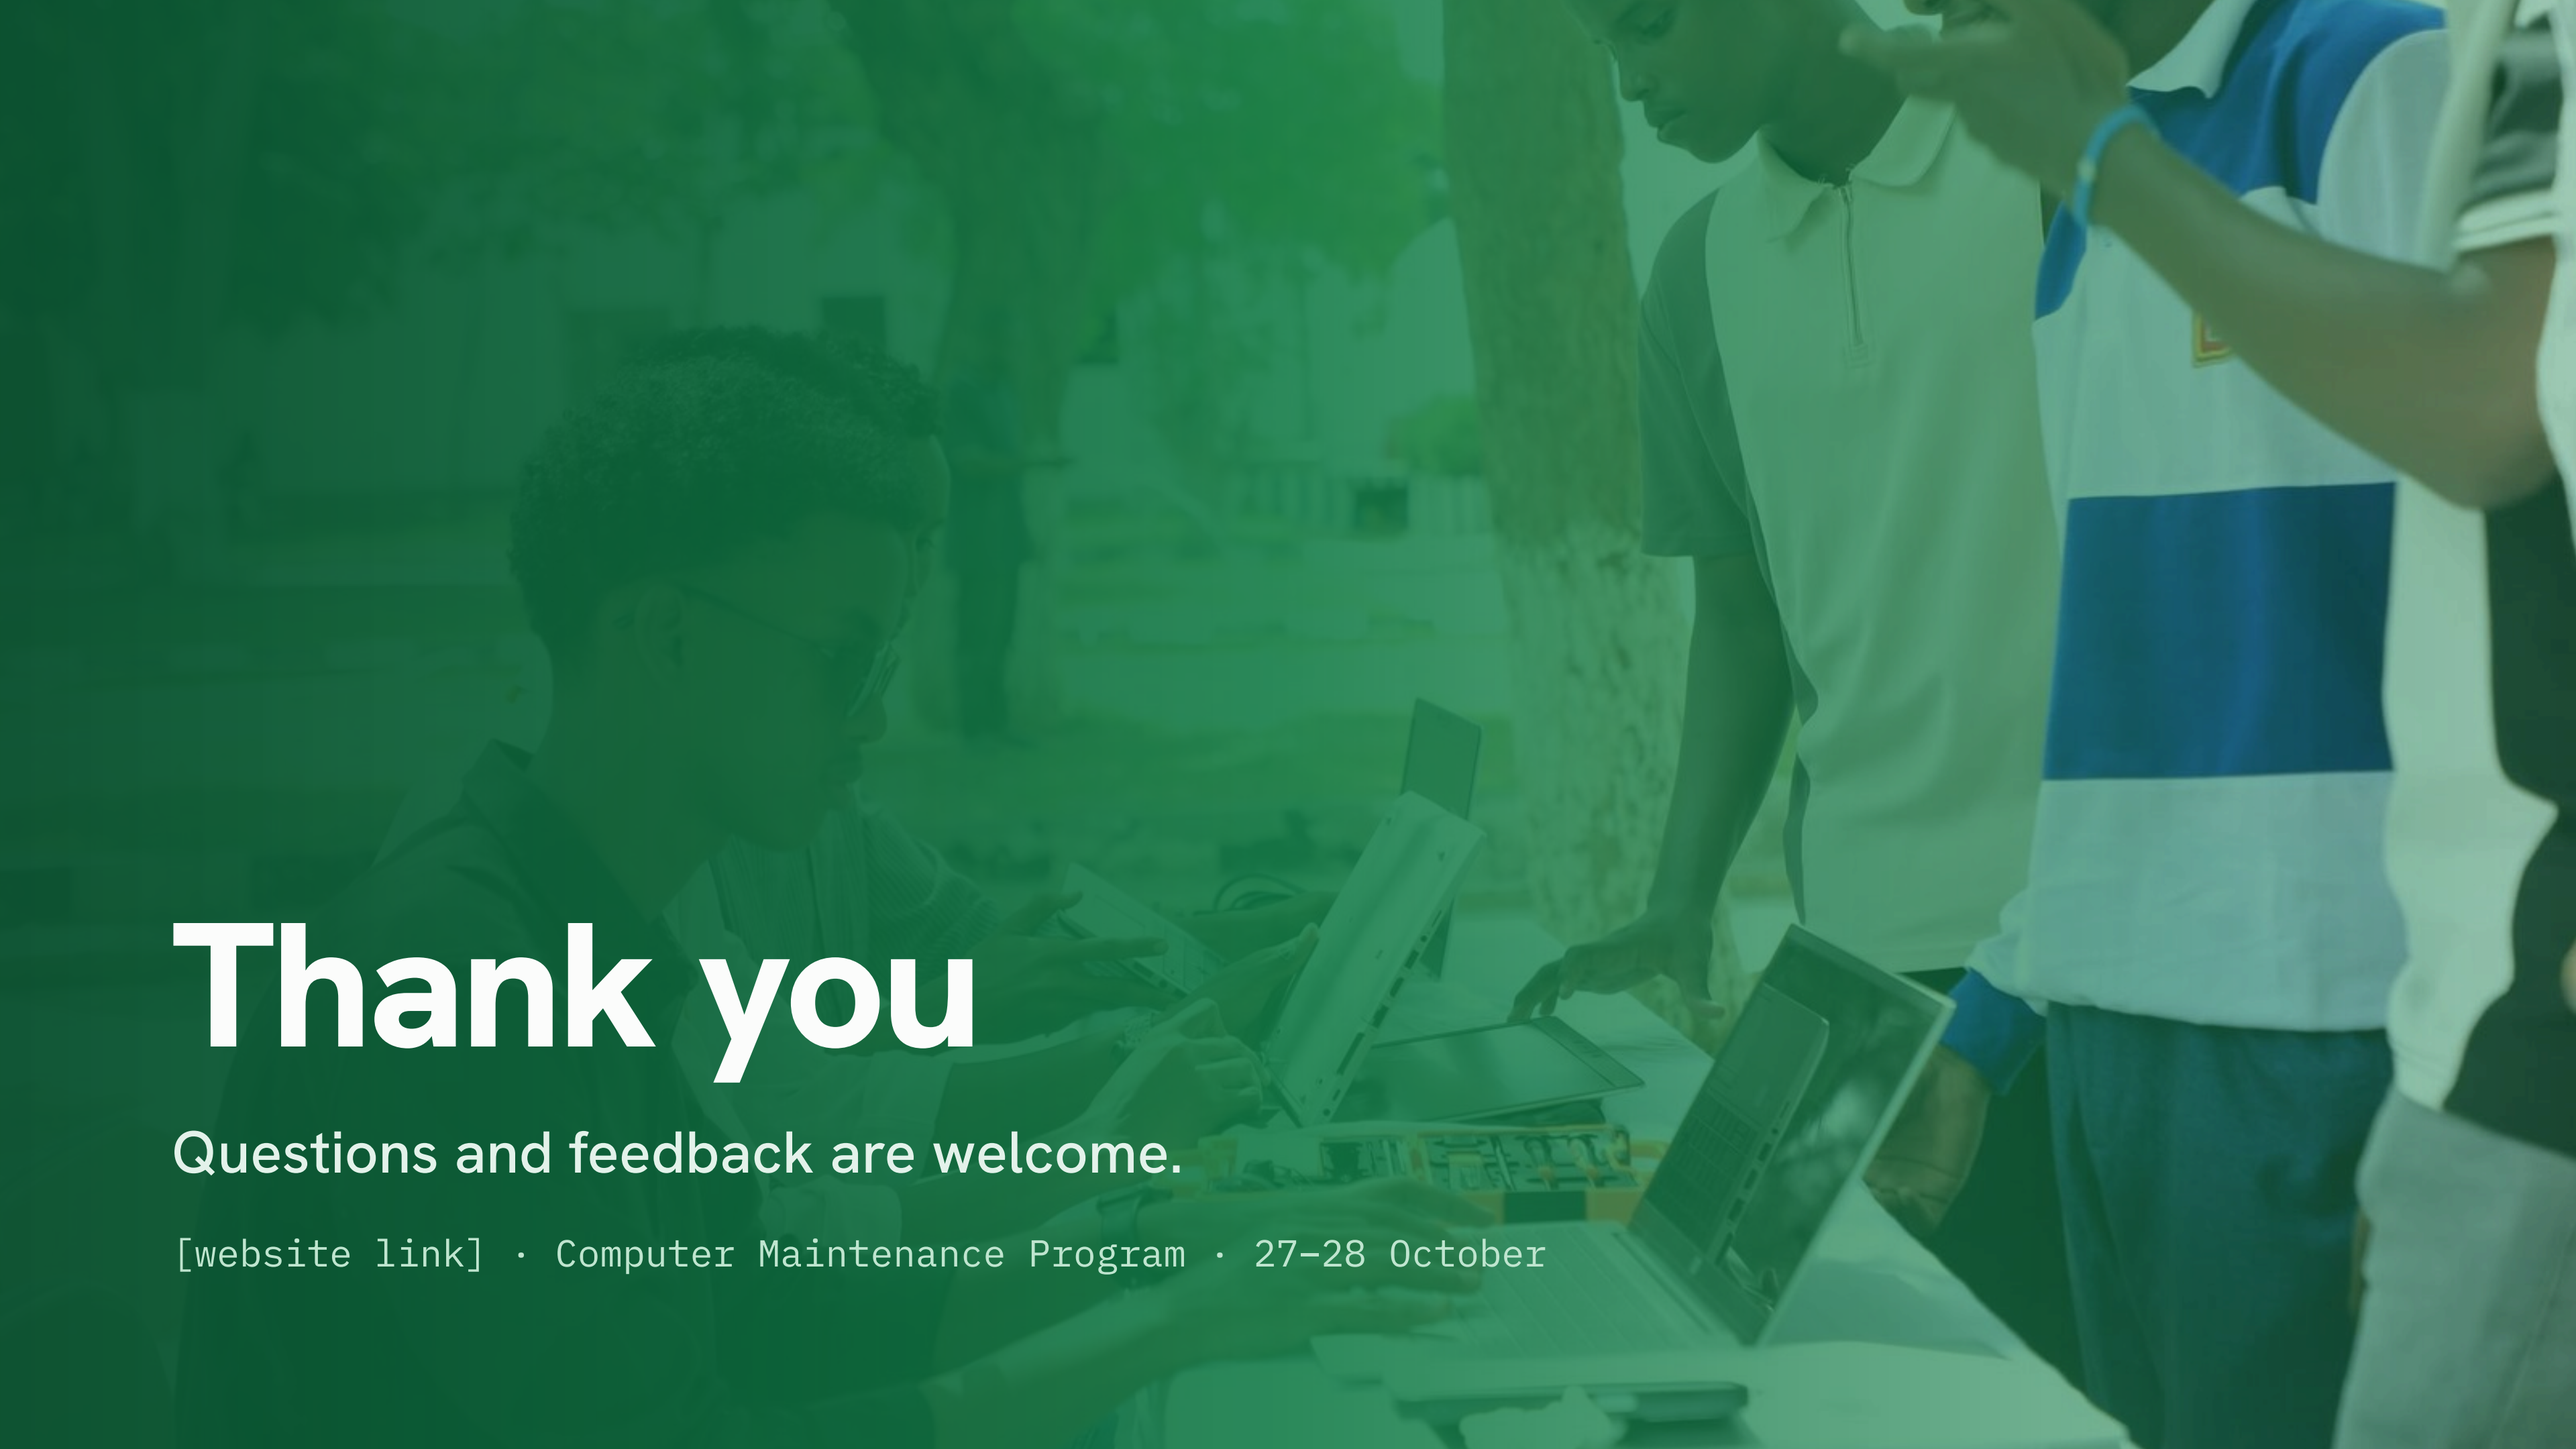

Eng. Ruweydo Hassan
Software Developer

Eng. Abdulsalam Hassan
Backend & AI Engineer

Delivered at the desk by Faculty of Computing student volunteers.

Thank you

Questions and feedback are welcome.
